

Razor Flush® Concorde-Electronics

Razor Flush® cutting edges feature no bevel on the cutters. This results in exceptionally sharp edges which produce cuts leaving virtually no raised surface or “pinch” on the end of the material being cut. The cutter actually operates like two razor blades coming together. Razor Flush® edge cutters are typically used when the highest level of precision is required working with small and/or very fine components. Although more frequent sharpening is required with Razor Flush® cutters, each cutter has a fine set screw stop built into the jaw of the cutter to protect the edges. The Razor Flush® edge finish on Tronex cutters is a proprietary process and the result is unmatched by any other precision cutting tool.
